Supervisory Patent Examiner, Art Unit 1794

See Continuation Sheet.

/E. G./ Examiner, Art Unit 1794 Continuation of 11, does NOT place the application in condition for allowance because:

Applicants note that page 7, lines 5-7 of the present specification discloses: "The acidic-soluble protein may be either of vegetable protein or animal protein, and a hydrolysate thereof may also be used." Applicants find that vegetable protein itself is clearly distriguished from its hydrolysate. Therefore, applicants find that because "the acidic-soluble protein is limited to an acidic-soluble soybean protein, it is clear that the acidic-soluble protein referred to herein is not a hydroysate thereof." Thus, applicants argue that given Nakayama discloses a sovbean protein hydrolysate. The claimed invention is clearly distinguished from Nakayama.

Given that the specification of the present invention discloses that "[t]he acidic-soluble protein may be either of a vegetable protein or animal protein and a hydrolysate thereof," since Nakayama discloses a hydrolysate of a vegetable protein, i.e. soybean protein, it is clear that Nakayama discloses an acidic-soluble soybean protein as presently claims.

Regarding the rejection of claims 5 and 7, applicants content that the "Examiner's position is untenable." Applicants argue that based on the Nakayma reference, the presently claimed invention is unobvious to one of ordinary skill in the art lost Nakayma does not teach or suggest the relief of astringency, much less the relief of astringency by combining the specific water-soluble polysaccharides.

Given that Nakayama et al disclose an acid-soluble soybean protein material identical to that presently claimed, it is clear that the acid-soluble protein material would intrinsically prevent the formation of dregs of cloudy-type fruit juice.
